ACKNOWLEDGEMENTS

This project would not have been possible without the U.S. Environmental Protection Agency, Region 8, Wetland Program grant and the contributions of expertise from over 50 Colorado botanists and ecologists, who donated their time and expertise to this project. A very special thank you to Jennifer Ackerfield, Gay Austin, Meghan Bowes, Justin Chappelle, Dina Clark, Carol Dawson, Carla DeYoung, Craig Freeman, Tim Hogan, David Inouye, Ann Lezberg, Anthony Massarro, Steve Olson, Lynn Riedel, Neil Snow, Crystal Strouse, Irene Weber, Jeanne Wenger, and Lorraine Yeatts, who contributed their time, expertise and data. Another special thank you to Joe Rocchio for his assistance and sharing his information and experiences with the FQA method. Karin Decker and Michelle Fink assisted with the database and other technical aspects. Dave Anderson, Denise Culver, Jill Handwerk, Susan Panjabi, and Peggy Lyon provided expertise on rare plant habitat data.

1.0 INTRODUCTION

The Floristic Quality Assessment (FQA) method is used to calculate several indices that reflect the condition of a site based on the plant species present. The core of the FQA method is the use of “coefficients of conservatism” (C-values), which are assigned to all native species in a flora following the methods described by Swink and Wilhelm (1994) and Wilhelm and Masters (1996). C-values range from 0 to 10 and represent an estimated probability that a plant is likely to occur in a landscape relatively unaltered from pre-European settlement conditions (Table 1). High C-values are assigned to species likely to occur in high-quality natural areas, while low C-values are assigned to species that tolerate modern human disturbance. FQA indices provide consistent, quantitative measures of floristic integrity that can be used in any plant community, do not require extensive sampling equipment, and can be applied to existing data sets. The evidence has shown that FQA is an accurate reflection of modern human disturbance (Rocchio and Crawford 2013, Spyreas 2019).

Table 1. C-value ranges and associated interpretation.

<i>C-Value</i>	<i>Interpretation</i>
0	Non-native species. Very prevalent in new ground or non-natural areas.
1-3	Commonly found in non-natural areas.
4-6	Equally found in natural and non-natural areas
7-9	Obligate to natural areas but can sustain some habitat degradation.
10	Obligate to high quality natural areas - no evidence species occurs outside high quality natural areas.

Initial C-values for Colorado species were assigned by a panel of botanical experts coordinated by the Colorado Natural Heritage Program (CNHP) in 2006 (Rocchio et al. 2007). The initial FQA panel was able to assign C-values to approximately 80% of Colorado’s estimated 3,191 taxa.

This report summarizes the 2020 update to the Colorado FQA focusing on five main areas:

- Updating taxonomy for the entire list of vascular plants in Colorado
- Evaluating native status of species with new native status designations
- Assigning C-values to taxa without values and updating selected taxa
- Data analysis of potential C-values
- Validation of C-values using previously collected field data

The updated 2020 FQA list includes 3,383 taxa of which 95% are assigned a C-value.

In addition to C-values, the updated FQA list includes a taxonomic crosswalk between Ackerfield (2015), USDA PLANTS (symbol and scientific name), and Weber and Wittmann (2012a, b). Additionally, the following fields are provided where available: National Wetland Plant List Wetland Indicator Status (U.S. Army Corps of Engineers 2018), Colorado Noxious Weed status

(Colorado Department of Agriculture 2020), and CNHP tracking status and global and state rarity ranks for species considered of conservation concern.

The FQA list with an updated crosswalk is in demand by Colorado land managers, researchers, and scientists who use the FQA to determine the condition of landscapes and wetlands.

2.0 METHODS

2.1 Taxonomic Update to the FQA Species List

The first task was to compile an updated vascular plant species list for Colorado. The plant list provided in Rocchio et al. (2007) included 3,191 taxa, of which 2,666 taxa were assigned a C-value and 525 taxa (16%) were not assigned a C-value. Because there have been substantial changes since 2007 related to nomenclature of species, as well as addition and deletion of species based on new information, an updated species list was needed prior to gathering C-value input from experts.

The original FQA species list was based primarily on nomenclature used by Weber and Wittmann (2001a, b) (Rocchio et al. 2007). For this update, the FQA species list was amended to include all taxa included in the most recent flora, *The Flora of Colorado* published by Jennifer Ackerfield in 2015. Taxa were crosswalked between Ackerfield (2015) and Weber and Wittmann (2001a, b) based primarily on notations within those sources. For taxa with no notations indicating synonymy within Ackerfield (2015) or Weber and Wittmann (2001a, b), other sources were consulted including Weber and Wittmann (2012 a, b), USDA PLANTS Database (USDA 2020), Interagency Taxonomic Information System (ITIS 2020), and Flora of North America (1993+). In some cases, synonymy is inconsistent between sources as the interpretation of the taxonomic identity of families, genera, species and subspecies/varieties varies. For example, sources differ in their interpretation of which species should be lumped into broader categories and which should be split into finer categories. For this updated FQA list, all taxa in Ackerfield (2015) were retained, taxa in Ackerfield (2015) that were not in the original list were added, and taxa from the original FQA list but not in Ackerfield (2015) were only retained if they were considered valid by multiple sources.

The nomenclature in the updated FQA list follows Ackerfield (2015) for those taxa included in Ackerfield, and follows USDA PLANTS (2020) for those taxa not included in Ackerfield.

2.2 Evaluation of Native Status

In Colorado, a C-value of 0 is assigned to species considered to be introduced to the state. Since the 2007 FQA, the native vs. non-native status of a number of species has been reevaluated. Primarily, many species previously considered non-native are currently considered native. These “newly native” species are in need of an updated C-value.

Because the assignment of native status is not always consistent between sources (e.g., The Biota of North America Program [BONAP] [Kartesz 2015], ITIS, Weber and Wittmann [2001a,b, 2012a,b], Ackerfield [2015]), assigning nativity was not clear cut. Native vs. non-native designations are often provided in regional floras, often without a rationale (Fertig 2011). The definition of a native plant is typically described as one that is found within its area of evolutionary origin, or arrived without human intervention (Pysek et al. 2004, in Fertig 2011). However, it is difficult to determine the origin of many species that are common around the world. Some authors believe that to determine

native/non-native status, at least eight parameters need to be evaluated including fossil evidence, pollen, historical data, geological distribution, genetic diversity, potential routes of introduction, reproductive patterns, known areas of native occurrences, etc. Gathering these parameters requires extensive work; even where available, analysis of these parameters does not always guarantee accuracy (Fertig 2011).

Some sources determine native vs. non-native status on a state level, some on a national level, and some based on the continental United States vs. North America. For the native vs. non-native status provided in the list for this project, we most frequently followed the state designation as assigned by BONAP (Kartesz 2015). The exceptions where we did not follow Kartesz (2015) are discussed in the Results section.

Species considered “Exotic” or “Adventive” by BONAP were assigned a FQA Native Status of non-native and assigned a C-value of 0, unless noted otherwise. The BONAP definition of “Adventive” is as follows:

“For the purpose of the Taxonomic Data Center, an adventive plant is a native plant that has been taken from its native range and released intentionally or unintentionally, or been disseminated elsewhere within the geographic area treated, through the direct or indirect influence of human activity.” <http://bonap.org/Help/Nativity.htm>

A few wetland species with unclear native status and known invasive behavior were treated separately. These species were assigned a native status of “cryptogenic” following methods used in the U.S. Environmental Protection Agency’s National Wetland Condition Assessment (NWCA) and described by Magee et al. (2019). Cryptogenic is defined as species with both native and non-native varieties and where the non-native variety is often invasive. Other sources define cryptogenic as species that are not demonstrably native or non-native (e.g., CABI 2020). For this FQA, species considered “cryptogenic” were assigned a C-value of 1.

The wetland taxa assigned “cryptogenic” native status were narrowleaf cattail (*Typha angustifolia*), hybrid cattail (*Typha ×glauca*), the genus cattail (*Typha* sp.), reed canarygrass (*Phalaris arundinacea*), and common reed (*Phragmites australis*). Narrowleaf cattail is often considered non-native in North America (Smith 1993+; Magee et al. 2019) but not all experts are in agreement (e.g., Shih and Finkelstein 2008). Regardless of native status, it is known that narrowleaf cattail, and its difficult-to-distinguish hybrids, can invade wetlands forming dense monocultures (Ciotir et al. 2013; Bansal et al. 2019). Similarly, reed canarygrass is generally considered non-native and can quickly dominate wetlands (e.g., Swearingen and Barger 2016; Kettenring et al. 2019). Common reed (*Phragmites australis*) includes two varieties of which one is considered native (var. *americanus*) and one which is not (var. *australis*). The problem lies in differentiating the two in the field. There are morphological keys that can help to separate the varieties of common reed but they are complex and rely on characters that are not always easy to distinguish throughout the season. Therefore, the native and non-native varieties of common reed are assigned individual C-values (3 and 0, respectively), and the cryptogenic full species is assigned a C-value of 1.

2.3 Assigning C-Values

Over 100 experts from universities, governmental agencies and local experts, were contacted in 2019 to determine their interest in participating in assigning Colorado C-values for species with no assigned C-values. Over 50 local and regional experts responded. Each participant received a spreadsheet listing species in need of C-values along with information on the FQA and a set of guidelines that have been established for assigning values. This information includes some of the common mistakes made over the years when assigning C-values that have been reported by Rocchio et al. (2007) and others was also included to ensure a common basis for assigning C-values (Appendix A). The experts submitted suggested C-values to CNHP.

In addition, two workshops were conducted to provide an interactive place for people to discuss not only how to assign C-values but to work together and come up with a consensus on values for a number of different species. The first workshop was held in Grand Junction, Colorado in conjunction with the Annual Rare Plant Symposium and the Colorado Native Plant Society meeting in September of 2019 and focused on West Slope species. The second workshop was held at Colorado State University in Fort Collins in October of 2019 to follow-up on the work done on the West Slope species and to focus on East Slope species. Before and after the workshops, CNHP solicited input from botanists with expertise in specific regions or specific plant groups to assist in assigning values. Other sources evaluated included CNHP element occurrence records, label data from herbarium specimens, and C-values assigned to the same species from other states or regions (e.g., Rocchio and Crawford 2013; Washkoviak et al. 2017). In some cases, no C-value was assigned due to lack of information.

2.4 Data Analysis

C-values were assigned to taxa in the following order of preference:

1. Rocchio et al. (2007) value retained
2. 2019 East Slope or West Slope Workshop value
3. Average value assigned by experts
4. CNHP assigned value

Rocchio et al. (2007) values were retained on the updated FQA list in most cases. For the species with no C-value assigned in 2007, the preferred method of assigning a C-value was using values agreed upon during the workshops. We considered the workshop-derived values the preferred method for assigning a value because they represented multiple experts discussing the species and agreeing on a value. In the absence of a workshop value, we used the average of values provided by individual experts. In the absence of outside expert input, CNHP assigned C-values to species with sufficient information on specimen labels or element occurrence records to allow a reasonable estimate.

The C-value input received from experts was compiled in a large data summary table. A number of experts included comments with their values and these comments were included in the summary

table. These comments were helpful in several situations, especially where there was a gap in agreement. For species with more than one value submitted by the experts, an average was taken unless there was a gap of more than three values. C-value submissions that differed by more than three values for an individual taxon were reviewed following the methodology of Rocchio et al. (2007). A total of 443 values were submitted from individual experts. There were 138 species with values contributed by more than one individual expert, of those only 16 were found to differ by more than three values. The variation ranged from 4-5 values. These 16 species were re-evaluated, some were discussed in workshops, reviewed in the literature or other available data, or specific experts were contacted. Certain experts who submitted values were prioritized in some instances. For example, if someone noted they had limited experience or moderate confidence with a particular species and someone else who was an expert in that species state submitted a value with high confidence, the value from the expert with the wider experience was utilized. These actions were documented in the spreadsheet so that as questions arise, documentation is available detailing how each C-value was assigned.

Most of the species previously considered non-native and currently considered native were assigned C-values by experts. The few that were not were not assigned a C-value by experts, but were known to be tolerant of disturbance, were assigned a C-value of 1. Finally, species with insufficient information due to rarity or other causes were not assigned a C-value. All non-native species were assigned a C-value of 0.

2.5 Validation of C-Values using Existing Data

Plot data generated for wetland condition assessments conducted by CNHP over the past 30 years were used to provide a level of validation for the C-values. The CNHP Wetland Plots Database¹ includes plant species lists and ecological condition data for nearly 3,000 wetland and riparian plots across the state. For species that occurred in at least five plots in the database, the average condition of the plots containing that species was compared to the C-value for that species. This allowed for evaluation of whether the assigned C-value reflected the habitat condition.

The condition data in the analysis include Land Disturbance Index (LDI) and habitat condition or quality data from ecological integrity assessments (EIAs) and CNHP element occurrence records (EORs). LDI is a GIS-based exercise taking into account distance from roads, oil and gas development, cultivation, and other anthropogenic disturbances, where a low LDI indicates low anthropogenic disturbance. The EIA and EOR habitat condition data are based on on-the-ground surveys at the plot locations.

¹ Please visit the Wetland Plots Database website for more information: <https://cnhp.colostate.edu/cwic/tools/plot-database/>

3.0 RESULTS

Fourteen botanical experts helped score the original FQA list (Rocchio et al. 2007). Twenty-seven botanical experts (including six members of the group who participated in the original list) submitted scores electronically for the 2020 update. Additional experts and practitioners contributed in two workshops that were conducted. A list of experts contributing data electronically is provided in Table 2.

The original FQA list compiled by Rocchio et al. (2007) included 3,191 taxa and was based primarily on Weber and Wittmann 2001 and USDA PLANTS (USDA 2005) as taxonomic sources. In 2009, the original FQA list was converted to an Access database and nomenclature was reviewed to ensure data integrity. Between 2009 and 2015, a few minor updates were made to the list as it was used for various wetland condition assessment projects. These updates added only a handful of species.

The updated list includes 3,383 taxa and is based on largely on the taxonomy of Ackerfield (2015) and USDA PLANTS (Table 3). The 2020 FQA list with C-values is provided in Appendix B. A crosswalk between Ackerfield 2015, PLANTS Database, and Weber and Wittmann 2012 will be available on the Colorado Wetland Information Center website <https://cnhp.colostate.edu/cwic/> in January 2021.

The approximately 200 additional species in the updated list include new discoveries of species documented in Colorado since 2007 and changes in taxonomy which have included both additions and deletions. The taxonomic changes and the inconsistencies between sources did not yield a linear transfer in the crosswalks as some authors do not recognize taxa that are recognized by other taxonomists. In some cases, scientific names have been changed to reflect new genetic information and some taxonomists accept the new names and others do not (or have not been updated). Some species are subsumed into a species and some are divided into separate taxa.

Sixty-eight species (~2%) retained in the updated FQA are not recognized by Ackerfield (2015); many of those have been subsumed as members of an existing taxa. For example, in the hawthorns (*Crataegus* spp.), *C. chrysocarpa* and *C. eurythropoda* are considered synonyms of *C. succulenta* by Ackerfield (2015) but the three are recognized as separate species by other taxonomists. These types of nomenclatural changes are recognized in the crosswalk. The lists are separate by author in the crosswalk to allow comparison between the master list (3,383 taxa), Ackerfield (2015) (3,315 taxa), USDA PLANTS (3,306 taxa), and Weber and Wittmann (2012a, b) (2,917 taxa).

The number of native vs. non-native species has shifted slightly from the original FQA list based on changes in some of the information available and the increase in the number of recognized taxa. In the final 2020 FQA list, 69 species previously considered non-native were changed to native based on a range of sources (Table 4). In 2007, 16% of the list was considered non-native versus 14% in 2020 (Table 2). Wyoming also reports 14% non-native species (Washkoviak et al. 2017).

Table 2. List of experts assigning Coefficient of Conservation (C-values) in 2007 and 2020. Bolded names participated in both 2007 and 2020.

Table 3. Comparison of the 2007 and 2020 Floristic Quality Assessment Species Lists.

	<i>FQA Species List 2007 (Rocchio 2007)</i>	<i>FQA Species List 2020</i>
Number of Taxa	3,191	3,383
Updated Taxa	Not Applicable	609 (18%)
Taxa Reviewed with no change to C-value	Not Applicable	99 (3%)
Taxa with no assigned C-value	525 (17%)	159 (5%)
Non-native or Cryptogenic Taxa	502 (16%)	475 (14%)

Native/non-native assignments were primarily based on BONAP (Kartesz 2015), with the exception of 41 taxa. These 41 include 4 taxa assigned a status of cryptogenic, 30 taxa assigned native status that BONAP considers non-native, 5 taxa assigned non-native status that BONAP considers native, and 2 taxa that are not included in BONAP. These 41 taxa are listed in Appendix C along with the rationale for the native status decision.

Several methods were used to evaluate species for C-value assignments (details included in the methods section). The 2007 C-value was retained for 77% of the list (2,615 taxa), a new C-value was assigned for 18% (609 taxa), and 5% (159 taxa) still have no assigned C-value due to lack of information caused by rarity and/or taxonomic ambiguity. For the 609 taxa with newly-assigned C-values, 9% were assigned during workshops, 74% were assigned as the average value from individual botanical experts, 15% were assigned by CNHP utilizing literature, research articles and herbarium data, and the remaining 2% were either previously non-native species assigned a C-value of 1 or new non-native species assigned a C-value of 0. In addition, the C-value was reviewed for 99 (4%) of the 2,616 taxa but the original C-value was retained. For these taxa, experts suggested C-values that were either equal to or within 2 units of the existing C-value. Overall, we evaluated 21% of the plant species with input from 27 panel members and ~50 workshop attendees. All newly assigned C-values are included in the full list in Appendix B.

The validation analysis using CNHP's Wetland Plots Database consisted of comparing LDI and field-based condition data to C-values for species that occurred in at least five plots. There were 975 such species. See Figure 1 for an example of the validation analysis. The evaluation only resulted in updating C-values for three species, however, because species with various C-values can occur across a range of conditions. Potentially problematic C-values identified through this validation were only changed if additional research or expert consultation supported the change. The species that did change had high C-values but the plot data indicated they consistently occurred in degraded habitat. One example was *Ranunculus aquatilis*, which was assigned a C-value of 10 in 2007. Field-based plot data documented this species commonly in anthropogenically disturbed sites across Colorado and less often in high quality wetlands. The C-value was updated from 10 to a

3 to reflect this data and was supported by the expert panel for those that updated this species. The list of species with updated C-values based on either the validation analysis or on input from experts is shown in Table 5. The C-values for an additional six taxa were updated to correct inconsistencies between the C-value of the full species relative to the subspecies (Table 6).

Table 4. Taxa considered non-native in Rocchio (2007) and native in the 2020 FQA list.

Scientific Name	2020 C-Value

<i>Gleditsia triacanthos</i>	0	1	Based on expert input by more than one expert (currently considered non-native in Colorado)
<i>Grindelia squarrosa</i>	3	1	Based on East Slope Workshop
<i>Mentzelia rhizomata</i>	7	9	Based on expert input by more than one expert (<i>Mentzelia argillosa</i> in Rocchio 2007)
<i>Penstemon fremontii</i>	7	9	Based on expert input by more than one expert
<i>Penstemon glaber</i>	7	5	Based on expert input by more than one expert
<i>Phalaris arundinacea</i>	1	0	Based on CNHP Wetland Team “cryptogenic” designation
<i>Phragmites australis</i>	1	3	Based on CNHP Wetland Team “cryptogenic” designation
<i>Physaria bellii</i>	6	4	Based on East Slope Workshop
<i>Ranunculus aquatilis</i>	3	10	Based on Wetland Plots Database analysis, East Slope Workshop, and expert input
<i>Typha angustifolia</i>	1	2	Based on CNHP Wetland Team “cryptogenic” designation
<i>Typha latifolia</i>	4	2	Based on CNHP Wetland Team expert input

Table 6. Taxa with updated C-value based on correcting an inconsistency between full species and subspecies.

<i>Scientific Name</i>	<i>2020 C-Value</i>	<i>2007 C-Value</i>
<i>Agoseris glauca</i>	7	6
<i>Eriogonum leptocladon</i>	7	8
<i>Opuntia polyacantha</i>	5	4
<i>Penstemon barbatus</i>	7	6
<i>Penstemon eatonii</i>	6	7
<i>Penstemon scariosus</i>	7	5

Figure 1. Example comparison of C-values for individual species and field-based condition data. This example shows a field-based assessment of land use intensity. The average condition across all sites where a species was observed was plotted against the species' original C-value. Species plotted within the central ellipse responded to average site conditions as expected. Species far beyond the central ellipse were investigated.

The distribution of final C-values demonstrated the largest number of species were assigned middle range (5-7) C-values. This distribution patterns were similar for the newly assigned values as they were to the total values. This was also the case when the 2007 distribution is compared to the 2020 distribution of C-values (Figure 2).

Figure 2. Comparison of 2007 and 2020 C-values

4.0 ACCESSING THE FQA LIST

The revised 2020 FQA list will be posted on CNHP's Colorado Wetland Information Center website <https://cnhp.colostate.edu/cwic/> in January 2021. The list can be downloaded as an Excel file or as a PDF. Additionally, the FQA calculator is available on the CNHP CWIC website. The FQA calculator allows users to enter a species list and calculate various FQA scores. The revised C-values will also be incorporated into the Colorado Wetland App.

Users of the FQA in Colorado are encouraged to submit information or opinions regarding specific C-value assignments to the CNHP. These contributions will be put towards periodic review and updates that will continue to improve the efficacy and quality of this metric.

APPENDIX A

Panel Guidelines and Information

for the 2019-2020

Revision of the Colorado Floristic Quality Assessment Indices

Panel Objectives

- 1) Panel members and experts willing to provide information will evaluate taxa for roughly 20% of the Colorado flora with no assigned C-values (prioritized list provided as separate attachment in email).
- 2) The panel experts will follow the guidelines provided for assigning C-values (below) on taxa for which a contributor will have experience and familiarity.
- 3) Submit your data by **September 05, 2019** via email to Pam Smith at the Colorado Natural Heritage Program (CNHP) pamela.smith@colostate.edu.
- 4) Panel members are encouraged to attend at least one panel discussion at two public forums. CNHP will compile and present the results at a workshop as part of the Rare Plant Symposium at the Colorado Native Plant Society Annual Meeting on September 27, 2019 and at a yet to be determined date in October in Fort Collins at Colorado State University. The meeting in October is to evaluate any of the taxa that were not assigned a value or that were problematic (agreements were not within three points between evaluators). Please note the results will be available to all panel members for comment, including those that cannot attend meetings.
- 5) The final revised list will be incorporated into the Colorado Wetland App and as a separate downloadable list from the CNHP website.

FQA Background Information

The FQA, originally developed for the Chicago region (Swink and Wilhelm 1979, 1994), assesses the degree of "naturalness" of an area based on the presence of species with high fidelity to habitat conditions unaltered from human-induced disturbances. The FQA uses "coefficients of conservatism" (C-values) to calculate a Floristic Quality Assessment Index (FQAI) to indicate "naturalness". The C-value, assigned to each species in the Colorado flora, indicates a plant's fidelity to habitat integrity and can be thought of as the relative probability that a particular plant is indicative of habitat conditions unaltered from human-induced disturbances (Rocchio 2007).

FQA methods have been developed in a number of states and provinces including Illinois (Swink and Wilhelm 1979, Taft et al. 1997), Missouri (Ladd 1993), Ohio (Andreas and Lichvar 1995), southern Ontario (Oldham et al. 1995), Michigan (Herman et al. 1996), Indiana (Coffee Creek Watershed Conservancy, 2001), North Dakota (Northern Great Plains Floristic Quality Assessment Panel, 2001), and Montana (Jones 2005).

C-values for Colorado species were assigned by a panel of botanical experts in 2006 (Rocchio 2007). FQA indices are included as a component of the Colorado Ecological Integrity Assessment (EIA) protocols, but they can also be used as stand-alone measures of biotic condition.

Table 1. C-value ranges and associated interpretation.

C-Value	Interpretation
0	Nonnative species, prevalent in new ground or obligate to non-natural areas.
1-3	Commonly found in non-natural areas.
4-6	Equally found in natural and non-natural areas.
7-9	Obligate to natural areas but can sustain some habitat degradation.
10	Obligate to high quality natural areas – no evidence species occurs outside high quality natural areas.

Considerations for Assigning C-Values

(Adapted in part from notes from Joe Rocchio and from the original FQA report (Rocchio 2007))

Consider each species individually. For example, do not think about values you have already assigned; an example might be something like: I have assigned the last few species fours, maybe I need more ones or tens. Just focus on the plant you are evaluating. Don't be afraid to assign a 10, if you believe it is a 10, assign a 10.

Endemics or Rare Species: During the first FQA workshop, rarity or endemism was occasionally being confused with conservatism. The FQA is not trying to assess rarity or presence of endemic species. A conservative species may or may not be rare. Likewise, a rare species may or may not be conservative. There are many different types of tools in the Botanical Toolbox, and FQA should not be used to answer a question it was not designed to address. *FQA is intended to assess floristic quality or integrity of a particular site.*

General comment about Coefficient of Conservatism: Need to consider historical demography of plants to understand coefficient of conservatism (C-value). Need to understand history of human occupancy and impacts to the landscape. Example: Midwestern woodlands were thought to be a climax community by modern ecologists. However, in comparison to 1840 land survey data it was apparent that modern Midwestern woodlands were actually a degraded system (due to fire suppression) compared to 1840 data (which was a fire dependent system).

Distribution of Conservative Species in a Flora: In the Floristic Quality Assessment in the Chicago Region paper, 89% of the native flora of the Chicago region has a C- value of 4 or higher. However, most *areas* in the Chicago region have a Mean C ranging from 0-2, highlighting the ubiquitous presence of ruderal, non-conservative species in the landscape despite the relative small proportion they constitute in the flora. Colorado has a much higher percentage of natural areas remaining in the landscape compared to the Chicago Region.

XYVE	Asteraceae	Xylorhiza venusta	5	Native			
YUANA2	Agavaceae	Yucca angustissima var. angustissima	7	Native			
YUBAB	Agavaceae	Yucca baccata var. baccata	6	Native			
YUBAB3	Agavaceae	Yucca baileyi var. baileyi	5	Native			
YUGL	Agavaceae	Yucca glauca	4	Native			
YUHA	Agavaceae	Yucca harrimaniae	7	Native			
YUNE4	Agavaceae	Yucca neomexicana	7	Native			
ZAPA	Zannichelliaceae	Zannichellia palustris	2	Native	OBL	OBL	OBL
ZEMA	Poaceae	Zea mays	0	Non-native			
ZIEL2	Melanthiaceae	Zigadenus elegans	6	Native	FACU	FACW	FACU
ZIPA2	Melanthiaceae	Zigadenus paniculatus	5	Native	FACU	FAC	FACU
ZIVEG	Melanthiaceae	Zigadenus paniculatus var. gramineus	5	Native	FACU	FAC	FACU
ZZ_ZIPAP50	Melanthiaceae	Zigadenus paniculatus var. paniculatus	5	Native	FACU	FAC	FACU
ZIVA	Melanthiaceae	Zigadenus vaginatus	9	Native	FAC		FAC
ZIVI	Melanthiaceae	Zigadenus virescens	5	Native	FAC	FAC	FACU
ZIGR	Asteraceae	Zinnia grandiflora	7	Native			
ZIAP	Apiaceae	Zizia aptera	6	Native	FAC	FAC	FAC
ZUBR	Chenopodiaceae	Zuckia brandegeei	7	Native			
ZYFA	Zygophyllaceae	Zygophyllum fabago	0	Non-native			

Appendix C. Taxa where BONAP Native Status Not Followed

FQA Scientific Name	FQA Native Status	FQA C-value	Native Status by Various Sources						Notes
			BONAP	USDA PLANTS	Ackerfield 2015	Weber & Wittmann 2012	ITIS	FNA	
<i>Achnatherum webberi</i>	Native	Not Assigned	Adventive	Native	Native	Not included	Native	Native	
<i>Acorus calamus</i>	Native	5	Exotic	Introduced	Native	Native	Introduced	Introduced	CNHP tracked species
<i>Amaranthus albus</i>	Non-native	0	Native	Introduced	Introduced	Alien	Introduced	Introduced	
<i>Amaranthus hybridus</i>	Native	3	Exotic	Native	Native	Introduced	Native	Native	
<i>Amaranthus palmeri</i>	Native	3	Adventive	Native	Native	Alien	Native	Native	
<i>Ambrosia artemisiifolia</i>	Native	1	Adventive	Both	Native	Alien	Both	Native	
<i>Ambrosia trifida</i> var. <i>trifida</i>	Native	3	Adventive	Native	Native	Alien	Native	Native	
<i>Anemopsis californica</i>	Native	3	Adventive	Native	Native	Alien	Native	Native	
<i>Chamaesyce maculata</i>	Native	3	Adventive	Native	Introduced	Alien	Native	Assumed native	
<i>Chenopodium album</i>	Non-native	0	Native (see Notes)	Both	Introduced	Alien	Both	Introduced	BONAP native status unclear. Online map indicates native, but taxon is on Colorado exotic list downloaded from website.
<i>Chenopodium album</i> var. <i>album</i>	Non-native	0	Native (see Notes)	Introduced	Introduced		Both	Introduced	BONAP unclear. Online map indicates native, but taxon is on Colorado exotic list downloaded from website.

FQA Scientific Name	FQA Native Status	FQA C-value	Native Status by Various Sources						Notes
			BONAP	USDA PLANTS	Ackerfield 2015	Weber & Wittmann 2012	ITIS	FNA	
<i>Chenopodium glaucum</i>	Non-native	0	Native (see Notes)	Introduced	Introduced	Alien	Both	Only the subspecies are assigned native status..	BONAP unclear. Online map indicates native, but taxon is on Colorado exotic list downloaded from website (see <i>Oxybasis glauca</i>).
<i>Chenopodium glaucum</i> var. <i>glaucum</i>	Non-native	0	Native (see Notes)	Introduced	Introduced	Alien	Introduced	Introduced	BONAP unclear. Online map indicates native, but taxon is on Colorado exotic list downloaded from website (see <i>Oxybasis glauca</i>).
<i>Chenopodium glaucum</i> var. <i>salinum</i>	Native	5	Ssp not in bonap	Native	Introduced	Not included	Native	Native	
<i>Chloris virgata</i>	Native	2	Exotic	Native	Native	Alien	Native	Native	
<i>Conyza canadensis</i>	Native	1	Exotic	Native	Non-native	Evidently native in eastern states and spreading west	Native	Thought to be native, now widely adventive	
<i>Deschampsia brevifolia</i>	Native	9	Adventive	Native	Native	Native	Native	Unclear from text	BONAP native status appears to be a mistake
<i>Disakisperma dubia</i>	Native	5	Adventive	Native	Native	Native	Native	Native	BONAP shows native in New Mexico
<i>Draba nemorosa</i>	Native	6	Exotic	Native	Native	Alien	Native	Introduced	
<i>Dysphania graveolens</i>	Native	7	Adventive	Both	Introduced	Alien	Native	Native	
<i>Erigeron strigosus</i> var. <i>strigosus</i>	Native	3	Adventive	Native	Native	Weed	Native	Native	

FQA Scientific Name	FQA Native Status	FQA C-value	Native Status by Various Sources						Notes
			BONAP	USDA PLANTS	Ackerfield 2015	Weber & Wittmann 2012	ITIS	FNA	
<i>Festuca trachyphylla</i>	Native	Not Assigned	Exotic	Introduced	Native	Alien	Introduced	Introduced	Native in Shaw (2008)
<i>Gentiana andrewsii</i>	Native	9	Adventive	Native	Native	Not included	Native	Not available	
<i>Geranium carolinianum</i>	Native	Not Assigned	Adventive	Native	Introduced	Not included	Native	Not available	
<i>Gnaphalium uliginosum</i>	Native	5	Exotic	Introduced	Introduced	Native	Introduced	"...native to Europe; ...not clear whether... North American plants may have been introduced "	
<i>Hornungia procumbens</i>	Native	6	Adventive	Native	Native	Alien	Native	Introduced	BONAP shows native nearby
<i>Impatiens capensis</i>	Native	4	Adventive	Native	Non-native	Uncertain	Native	Not available	BONAP shows only Colorado as adventive
<i>Juncus effusus</i>	Native	4	Exotic	Native	Introduced	Alien	Native	Native	BONAP shows only Colorado as exotic
<i>Lactuca canadensis</i>	Native	6	Adventive	Native	Native	Native	Native	Native	
<i>Madia glomerata</i>	Native	3	Adventive	Native	Introduced	Alien	Native	Native	
<i>Malvella leprosa</i>	Native	7	Adventive	Native	Introduced	Native	Native	Native "possibly introduced in Colorado"	

FQA Scientific Name	FQA Native Status	FQA C-value	Native Status by Various Sources						Notes
			BONAP	USDA PLANTS	Ackerfield 2015	Weber & Wittmann 2012	ITIS	FNA	
<i>Oxalis stricta</i>	Native	1	Adventive	Native	Introduced	Unstated (Alien in Weber and Wittmann 2000)	Native	Probably introduced	
<i>Penstemon cobaea</i>	Native	10	Adventive	Native	Native	Native	Native	Not Available	
<i>Phalaris arundinacea</i>	Cryptogenic	1	Native	Native	Native	Alien	Native	Native	
<i>Phalaris caroliniana</i>	Native	Not Assigned	Adventive	Native	Native	Alien?	Native	Native	CNHP watch list species
<i>Phragmites australis</i>	Cryptogenic	1	Exotic	Both	Native	Native	Native	Unclear from text	
<i>Poa pratensis</i> ssp. <i>agassizensis</i>	Native	4	ssp. not in BONAP	Introduced	Considered synonym of <i>Poa pratensis</i> (introduced)	Native	Both	"It may consist of ecotypes derived from cultivated material, or be a native form that has adapted to xeric conditions."	
<i>Spergularia salina</i>	Native	4	Adventive	Native	Introduced	Unstated Alien in Weber and Wittmann 2000	Native	Introduced and native	

FQA Scientific Name	FQA Native Status	FQA C-value	Native Status by Various Sources						Notes
			BONAP	USDA PLANTS	Ackerfield 2015	Weber & Wittmann 2012	ITIS	FNA	
<i>Typha xglauca</i>	Cryptogenic	1	Exotic	Both	Not in Ackerfield 2015	---	Native		
<i>Typha angustifolia</i>	Cryptogenic	1	Exotic	Both	Native	Native	Native	Unclear, suggest introduced	
<i>Veronica anagallis-aquatica</i>	Native	1	Exotic	Native	Native	Unstated. Alien in Weber and Wittmann 2000	Native	Introduced
