I. MODEIN2:

The Modified Einstein Procedure

## 1. INTRODUCTION

Program MODEIN2 computes the total sediment load and its size distribution in sandbed channels. The procedure used is the Modified Einstein Procedure (MEP) developed by the U.S. Geological Survey [1] and the U.S. Bureau of Reclamation [2,3]. Essentially, the MEP is based on the direct measurement of hydraulic quantities, bed-material size and the suspended load (except within a small distance near the bed) in an alluvial channel. The procedure extrapolates the sediment discharge in the unmeasured zone, thus calculating the total sediment load. The MEP has the same phenomenological structure as Einstein's Bed-Load function [4] with some modifications in the empirical components.

The sediment load computation by the MEP is more accurate than by other computational methods, mainly because the MEP is based on the direct measurement of the hydraulic and sediment transport quantities. This is especially true in sandbed channels where a large proportion of the total sediment load is transported in the sampled zone and is actually measured. The MEP is only applicable where the basic hydraulic and sedimentation parameters have been measured in the field.

## 2. MAIN FEATURES OF MODEIN2

Program MODEIN2 basically follows the computational procedure outlined in reference (2). However, in order to make the program more reliable, two additional features have been included:

- 1) The calculation of the Rouse number for fractions other than the reference size is based on the correction suggested on reference (3).
- 2) The integral functions that are used in the procedure are evaluated by using the algorithm developed by Li (5). The method consists of expanding the integral functions in the form of power series.

With this approach, the computer time is considerably reduced, and the desired degree of accuracy can be selected by the user to satisfy the needs of a particular problem. In the analysis of several test runs with different values of the convergence parameter CONV, a value of CONV=0.01 has generally been found to satisfy both accuracy and computer time requirements.

### 3. INPUT-OUTPUT DESCRIPTION

MODEIN2 can be set up to read and analyze as many runs as needed. For each series of runs analyzed at one time, the program provides an option to use either the 1:2 ratio sieve sizes in reference [2] or any other series specified by the user.

The output can be limited to the sedimentation quantities related to total load, or extended to print additional hydraulic parameters and intermediate computational values.

Details of input-output controls follow:

A) NUMBER OF SETS CARD. This is the first card in the input record and contains the value of NDATA in format I5. NDATA is the number of sets to be analyzed at one time. Each set of input data consists of a group of variables related to one observation, as detailed below. It should be emphasized that one observation may relate to the computation of the sediment load in the whole of the cross section or the load in a subsection or a vertical, as the case may be.

This first card is to be followed by the individual sets of input data, each consisting of the following.

B-1) GENERAL DATA CARDS. Two cards should be used for the input of the general data (13 variables in format 8F10.0).

The following names are used for the variables:

<u>VARIABLES</u>	<u>FORTRAN NAME</u>	<u>UNITS</u>
Water Discharge	DISCH	cu ft per sec
Average Velocity	UAVE	ft per sec
Hydraulic Depth	DEPTH	ft
Water Surface Width	W	ft
Area of Cross-Section	AREA	sq ft
Temperature	TEMP	°F
Kinematic Viscosity	XNU	sq ft per sec
65 Percent Finer Diameter for Bed Material	D65	ft
35 Percent Finer Diameter for Bed Material	D35	ft
Average Concentration	CONC	ppm
Sampled Suspended Load	QSM	tons per day
Portion of Depth Not Sampled	DN	ft
Average Depth of Sampling	DS	ft

B-2) INPUT-OUTPUT OPTIONS CARD. The values of JIN and JOUT should be punched in format 2I1 according to the following options:

JIN: Selects the number and range in the size fractions that will be analyzed. ND is the number of fractions. The following options can be used:

JIN=1 The size fractions utilized in reference (2) will be used. In this case, the first two size fractions will be used and the third one deleted, hence resulting in ND=10

JIN=2 The size fractions mentioned in reference (2) will also be used, but the first two size fractions will be deleted and the third one used instead, resulting in ND=9.

JIN=3 The user has the option of specifying the number and range of the size fractions to be computed, up to nine fractions. If this option is chosen, then ND should be read immediately after the input-output card, in format I1. Also, changes in the data arrays should be made, as will be detailed below (see B-3).

JOUT: Selects the type of output desired. The following options can be used for JOUT:

JOUT=1 In this case, the output will consist of the general data, the check on convergence of Z prime and the final results in 20 columns, as follows:

- 1) Geometric mean diameter, in ft
- 2) PSI
- 3) PHI shear
- 4) Percentage of bed material in size fraction
- 5) Bed load transport, in tons/day
- 6) Percentage of suspended load in size fraction
- 7) Sampled transport in size fraction
- 8) Multipliers
- 9) A prime values
- 10) A double prime values
- 11) Geometric mean diameter, in ft
- 12) J-one prime
- 13) J-two prime
- 14) J-one double prime
- 15) J-two double prime
- 16) Product of J's
- 17) I-one double prime
- 18) I-two double prime
- 19) Product of I's
- 20) Computed load, in tons/day

JOUT=2 Only columns 1, 4, 5, 6 and 20 will be printed and the rest will be omitted. Additionally, the lower and upper limits of the size fraction range, in mm, DRL(J) and DRU(J), will be printed on the left side of the five previously mentioned columns.

B-3) DATA ARRAYS CARDS. The number of cards and the input depends on the value of JIN.

JIN=1 Ten cards are required in this case, each containing both the values of the fraction of bed material FB(J) and the fraction of suspended load FS(J) punched in format 2F10.0, for each particular size range.

JIN=2 The input consists of nine cards with the same information as in JIN=1 punched in format 2F10.0.

JIN=3 In addition to the percentages FB(J) and FS(J), the range of the computational size fractions should be specified. Hence, DRL(ND),

DRU(ND), FB(ND) and FS(ND) should be punched in format 4F10.0, being DRL(J) and DRU(J) the lower and upper limits of each particular size fraction range in mm respectively. Note that size fractions should be punched in the order of increasing size.

A sequence of three runs is illustrated for the following job setup. Different integer selections for JIN and JOUT have been used for illustration. The corresponding output follows the data card assembly example.

## 4. FORTRAN NAMES FOR INPUT AND OUTPUT VARIABLES

INPUT

Water discharge	DISCH
Average velocity	UAVE
Hydraulic depth	DEPTH
Water surface width	W
Area	AREA
Temperature	TEMP
Kinematic viscosity	XNU
65 percent finer diameter for bed-material	D65
35 percent finer diameter for bed-material	D35
Average concentration	CONC
Sampled suspended load	QSM
Portion of depth not sampled	DN
Average depth of sampling	DS

OUTPUT

Geometric mean diameter, in ft	D(J)
PSI	PSI(J)
PHI shear	PHISH(J)
Percentage of bed-material in size fraction	FB(J)
Bed-load transport, in tons/day	XIBQB(J)
Percentage of suspended load in size fraction	FS(J)
Sampled transport in size fraction	QSP(J)
Multipliers	XMULT(J)
Z prime values	ZP(J)
A double prime values	APP(J)
Geometric mean diameter, in ft	D(J)
J-one prime	COL16(J)
J-two prime	COL17(J)
J-one double prime	COL18(J)
J-two double prime	COL19(J)
Product of J's	COL20(J)
I-one double prime	COL21(J)
I-two double prime	COL22(J)
Product of I's	COL23(J)
Computed load, in tons/day	FQL(J)
Trial Z	ZTRY
Real $Q_s$ '	RQSP
Computed $Q_s$ '	CRQSP
Difference of real and computed $Q_s$ '	DCRQ
Settling velocity	VS(J)
Total bed load	TBL
Total suspended bed material load	TSL
Total bed material load	TQL

## 5. EXAMPLES

The diagram illustrates the setup of data cards for the MODEIN2 program, showing a stack of cards for two different sets of data.

**Top Stack (Set 2):**

- DATA ARRAYS (J=1.4):** Contains numerical data for DRI(J), DRU(J), FB(J), and FS(J).
- NUMBER OF FRACTIONS CARD:** ND = 22.
- INPUT-OUTPUT OPTIONS CARD:** INJOUT = 22.
- 2 GENERAL DATA CARDS:**
  - Card 1: D<sub>35</sub> = 0.000557, CONC = 1160., QSM = 51051.6, DN = 0.5, DS = 9.70.
  - Card 2: DISCH = 16300., UAVE = 4.11, DEPTH = 10.2, W = 389., AREA = 3956., TEMP = 62.0, XNU = 0.0000109, D<sub>65</sub> = 0.000673.

**Bottom Stack (Set 1):**

- DATA ARRAYS (J=1.9):** Contains numerical data for FB(J) and FS(J).
- INPUT-OUTPUT OPTIONS CARD:** INJOUT = 21.
- 2 GENERAL DATA CARDS:**
  - Card 1: D<sub>35</sub> = 0.00075, CONC = 262., QSM = 163., DN = 0.30, DS = 1.22.
  - Card 2: DISCH = 230., UAVE = 2.08, DEPTH = 0.98, W = 113., AREA = 111., TEMP = 64.0, XNU = 0.0000114, D<sub>65</sub> = 0.00105.

**Bottom Card (Set 1):**

- NUMBER OF SETS CARD:** NDATA = 2.
- UNIVERSITY COMPUTER CENTER:** Includes the logo of Colorado State University and the text "UNIVERSITY COMPUTER CENTER".

```

DEVELOPED COLORADO STATE UNIVERSITY ENGINEERING RESEARCH  
 CENTER, FORT COLLINS, COLORADO, 80523.  
 PURPOSE COMPUTATION OF TOTAL SEDIMENT DISCHARGE BY  
 THE MODIFIED EINSTEIN PROCEDURE.  
 REFERENCES U.S. BUREAU OF RECLAMATION PUBLICATION  
 STEP METHOD FOR COMPUTING TOTAL SEDIMENT LOAD  
 BY THE MODIFIED EINSTEIN PROCEDURE, JULY 1955  
 (REVISED) AND ADDENDUM COMPUTATION OF Z FOR USE  
 IN THE MODIFIED EINSTEIN PROCEDURE, JUNE 1966.  
 CORE USAGE CDC 6400 SCOPE 3.3 SYSTEM DEFAULT VALUE,  
 43000 UCTAL.  
 COMPILATION TIME APPROXIMATELY 8 SEC.  
 CENTRAL PROCESSOR  
 TIME FOR ONE  
 SET OF DATA APPROXIMATELY 1 SEC.

INPUT AND OUTPUT DESCRIPTION  
 THE FIRST CARD IN THE INPUT LOGICAL RECORD SHOULD CONTAIN  
 THE VALUE OF NDATA, IN FORMAT 15. NDATA IS THE NUMBER OF SETS  
 OF INPUT DATA TO BE FED TO THE COMPUTER AT A TIME. A SET OF INPUT  
 DATA CONSISTS OF A GROUP OF VARIABLES NECESSARY TO SPECIFY  
 A PROBLEM, AS DETAILED BELOW.  
 THE FIRST CARD IS TO BE FOLLOWED BY THE NUMBER OF SETS OF INPUT  
 DATA, EACH ONE CONSISTING OF THE FOLLOWING, IN THE ORDER SHOWN  
 (ORDER IS THE SAME AS THAT USED IN REFERENCE 8)

- 1) GENERAL DATA, 13 VARIABLES TO BE PUNCHED IN FORMAT (8F10.0)  
 FOLLOWING IS A LIST OF THE VARIABLES, FORTRAN NAME AND UNITS.  
 WATER DISCHARGE DISCH CFS.  
 AVERAGE VELOCITY UAVE FT./SEC.  
 HYDRAULIC DEPTH DEPTH FT.  
 WATER SURFACE WIDTH W FT.  
 AREA AREA SQ.FT.  
 TEMPERATURE TEMP DEG.FARENH.  
 KINEMATIC VISCOSITY XNU SQ.FT./SEC.  
 65 PERCENT FINER DIAMETER  
 FOR BED-MATERIAL D65 FT.  
 35 PERCENT FINER DIAMETER  
 FOR BED-MATERIAL D35 FT.  
 AVERAGE CONCENTRATION CONC PPM.  
 SAMPLED SUSPENDED LOAD QSM TONS/DAY  
 PORTION OF DEPTH NOT SAMPLED DN FT.  
 AVERAGE DEPTH OF SAMPLING DS FT.
- 2) INTEGER SELECTORS JIN AND JOUT, TO BE PUNCHED IN FORMAT 211.  
 JIN SELECTS THE NUMBER AND RANGE IN THE COMPUTATIONAL  
 SIZE FRACTIONS. ND IS THE NUMBER OF SIZE FRACTIONS.  
 IF JIN=1, THE SIZE FRACTIONS IN THE USBR PUBLICATION WILL BE  
 USED. THE FIRST TWO SIZE FRACTIONS WILL BE USED AND THE THIRD  
 DELETED, RESULTING IN ND=10.  
 IF JIN=2, THE SIZE FRACTIONS IN THE USBR PUBLICATION WILL BE  
 USED. IN THIS CASE THE FIRST TWO SIZE FRACTIONS WILL BE DELETED  
 AND THE THIRD USED INSTEAD, RESULTING IN ND=9.  
 IF JIN=3, THE USER HAS THE OPTION OF SPECIFYING THE NUMBER AND  
 RANGE OF COMPUTATIONAL SIZE FRACTIONS. IF THIS OPTION IS  
 CHOSEN, ND SHOULD BE READ IN THE CARD IMMEDIATELY FOLLOWING.  
 IN FORMAT 11.  
 JOUT SELECTS THE TYPE OF OUTPUT DESIRED.  
 IF JOUT=1, OUTPUT WILL CONSIST OF THE GENERAL DATA, CHECK ON  
 CONVERGENCE OF Z PRIME, AND THE FINAL RESULTS IN 20 COLUMNS,  
 AS FOLLOWS.

- 1) GEOMETRIC MEAN DIAMETER, IN FT.  
 2) PSI  
 3) PHI SHEAR  
 4) PERCENTAGE OF BED MATERIAL IN SIZE FRACTION  
 5) BED LOAD TRANSPORT, TONS/DAY  
 6) PERCENTAGE OF SUSPENDED LOAD IN SIZE FRACTION  
 7) SAMPLED TRANSPORT IN SIZE FRACTION  
 8) MULTIPLIERS  
 9) Z PRIME VALUES  
 10) A DOUBLE PRIME VALUES  
 11) GEOMETRIC MEAN DIAMETER, IN FT  
 12) J ONE PRIME  
 13) J TWO PRIME  
 14) J ONE DOUBLE PRIME  
 15) J TWO DOUBLE PRIME  
 16) PRODUCT OF JS  
 17) I ONE DOUBLE PRIME  
 18) I TWO DOUBLE PRIME  
 19) PRODUCT OF IS  
 20) COMPUTED LOAD, IN TONS/DAY  
 IF JOUT=2 IS SELECTED, MOST OF THE 20 COLUMNS WILL BE OMITTED  
 IN THE PRINTOUT, AND INSTEAD ONLY COLUMNS 1,4,5,6 AND 20 WILL  
 BE PRINTED. ADDITIONALLY, DRL(J) AND DRU(J), LOWER AND UPPER  
 LIMITS OF THE SIZE FRACTION RANGE, IN MM, WILL BE PRINTED TO  
 THE LEFT OF THE 5 COLUMNS PREVIOUSLY MENTIONED.
- 3) DATA ARRAYS.  
 IF JIN=1, THE PERCENT OF BED MATERIAL IN SIZE FRACTIONS FR(10),

```

C      AND PERCENT OF SUSPENDED LOAD IN SIZE FRACTIONS FS(10)          MOD 970
C      SHOULD BE PUNCHED IN FORMAT 2F10.0                             MOD 980
C      IF JIN=2, FB(9) AND FS(9) SHOULD BE PUNCHED IN FORMAT 2F10.0   MOD 990
C      IF JIN=3, THE RANGE OF COMPUTATIONAL SIZE FRACTIONS SHOULD BE   MOD 1000
C      SPECIFIED IN ADDITION TO THE PERCENTAGES FB AND FS.             MOD 1010
C      IF THIS OPTION IS CHOSEN, DRL(ND), DRU(ND), FB(ND) AND FS(ND)    MOD 1020
C      SHOULD BE PUNCHED IN FORMAT 4F10.0                             MOD 1030
C      DRL(J) AND DRU(J) ARE THE LOWER AND UPPER LIMITS OF THE SIZE    MOD 1040
C      FRACTION RANGE, IN MM, RESPECTIVELY. NOTE THAT SIZE FRACTIONS   MOD 1050
C      SHOULD BE PUNCHED IN ORDER OF INCREASING SIZE.                 MOD 1060
C                                                                           MOD 1070

## II. COLBY:

### Colby's Bed Material Load Method

## 1. INTRODUCTION

Program COLBY computes bed material load by Colby's Method [1]. Data input consists of average velocity (ft per sec), hydraulic depth (ft), water surface width (ft), temperature (°F), median bed material size (mm) and fine material concentration (ppm). A remark included as part of the output indicates whether the computations were carried out in a normal fashion, or if one or more variables were out of the value range specified in this method. If velocity, depth or bed material size are out of range, the program fails to give any results. If temperature or fine material concentration are out of range, the program extrapolates and gives a result, albeit of limited value.

## 2. INPUT-OUTPUT DESCRIPTION

### INPUT:

#### A) NUMBER OF SETS CARD

It is the first card in the input logical record and should contain the value of NDATA, in format I5. NDATA is the number of sets of input data to be fed to the computer at a time. A set of input data consists of a group of variables necessary to specify a problem, as detailed below.

#### B) INPUT DATA CARDS

The first card in input is followed by the sets of input data, to be punched in format 6F10.0. A set of input data consists of the following variables, relating to a channel cross section.

<u>VARIABLES</u>	<u>FORTTRAN NAME</u>	<u>UNITS</u>
1) Average Velocity	V	ft per sec
2) Hydraulic Depth	D	ft
3) Water Surface Width	W	ft
4) Temperature	TF	°F
5) Median Bed Material Size	D50	mm
6) Fine Material Concentration	FML	ppm

## OUTPUT:

Output consists of the total bed material transport in tons/day, and a remark on how the computations were carried out. If REMARK=OK, the computations were carried out successfully. If REMARK=OOR, velocity, depth or bed material size is out of range. If REMARK=TOOR, temperature is out of range. If REMARK=FOOR, fine material concentration is out of range.

<u>VARIABLE</u>	<u>RANGE</u>
Average Velocity	1-10 ft per sec
Hydraulic Depth	1-100 ft
Temperature	32-100 °F
Median Bed Material Size	0.1-0.8 mm
Fine Material Concentration	0-200000 ppm

## 3. FORTRAN NAMES FOR INPUT AND OUTPUT VARIABLES

<u>VARIABLE</u>	<u>FORTRAN NAME</u>
Average Velocity	V
Hydraulic Depth	D
Water Surface Width	W
Temperature	TF
Median Bed Material Size	D50
Fine Material Concentration	FML
Bed Material Transport	GT

## 4. EXAMPLES

The diagram illustrates the setup of data cards for the COLBY program. It consists of a stack of four 'INPUT DATA CARDS' and a 'NUMBER OF SETS CARD'.

The top 'INPUT DATA CARD' shows the following fields and values:

V	D	W	TF	D <sub>30</sub>	FNL
4.92	4.14	234.	70.0	0.32	300000.

The 'NUMBER OF SETS CARD' contains a grid of data organized into columns. The columns are labeled as follows:

- Column 1: 0000000000
- Column 2: 0000000000
- Column 3: 0000000000
- Column 4: 0000000000
- Column 5: 0000000000
- Column 6: 0000000000
- Column 7: 0000000000
- Column 8: 0000000000

- Column 100: 0000000000

The 'NUMBER OF SETS CARD' also features a circular seal for Colorado State University, established in 1870, and the text 'UNIVERSITY COMPUTER CENTER'.

Setup of Data Cards for COLBY

COMPUTATION OF TOTAL RED MATERIAL  
TRANSPORT BY COLBYS METHOD

SET 1  
 AVERAGE VELOCITY 9.92 FT./SEC.  
 HYDRAULIC DEPTH 4.14 FT.  
 WATER SURFACE WIDTH 234.00 FT.  
 TEMPERATURE 70.00 DEG.FAHREN.  
 MEDIAN BED MATERIAL SIZE .32 MM.  
 FINE MATERIAL CONCENTRATION 10000.00 PPM.  
 RED MATERIAL TRANSPORT = 76173.08304 TONS/DAY  
 REMARK = OK

SET 2  
 AVERAGE VELOCITY 11.00 FT./SEC.  
 HYDRAULIC DEPTH 4.14 FT.  
 WATER SURFACE WIDTH 234.00 FT.  
 TEMPERATURE 70.00 DEG.FAHREN.  
 MEDIAN BED MATERIAL SIZE .32 MM.  
 FINE MATERIAL CONCENTRATION 10000.00 PPM.

COMPUTATIONS COULD NOT BE CARRIED OUT  
 DUE TO DATA OUT OF RANGE  
 REMARK= OOR

SET 3  
 AVERAGE VELOCITY 9.92 FT./SEC.  
 HYDRAULIC DEPTH 4.14 FT.  
 WATER SURFACE WIDTH 234.00 FT.  
 TEMPERATURE 105.00 DEG.FAHREN.  
 MEDIAN BED MATERIAL SIZE .32 MM.  
 FINE MATERIAL CONCENTRATION 10000.00 PPM.  
 RED MATERIAL TRANSPORT = 59231.54605 TONS/DAY  
 REMARK = TOOR

SET 4  
 AVERAGE VELOCITY 9.92 FT./SEC.  
 HYDRAULIC DEPTH 4.14 FT.  
 WATER SURFACE WIDTH 234.00 FT.  
 TEMPERATURE 70.00 DEG.FAHREN.  
 MEDIAN BED MATERIAL SIZE .32 MM.  
 FINE MATERIAL CONCENTRATION 300000.00 PPM.  
 RED MATERIAL TRANSPORT = 810518.47909 TONS/DAY  
 REMARK = FOOR
