Climatology Report No. 86-5

ACKNOWLEDGMENTS

The authors wish to thank the Department of Atmospheric Science at Colorado State University and the City of Fort Collins Light and Power Utility for the support of this joint cooperative endeavor to improve our understanding of the solar energy resource. We are also appreciative of the efforts of the staff of weather observers at the Campus Weather Station who have helped make the project a success. Funding for this ongoing project has been shared by the Colorado Agricultural Experiment Station and Fort Collins Light and Power. We hope this example will lead to similar cooperative endeavors throughout Colorado.

1. INTRODUCTION

Energy from the sun, solar radiation, is the basic source of energy on our globe. An understanding of the magnitude and variation of this energy source is very important from many perspectives. It is the fundamental driving force for global weather and climate patterns. It influences how and where we live. And it has many economic ramifications, influencing water supply and agriculture as well as the costs of heating homes and businesses. In recent years much attention has been focused on the substitution of solar energy for conventional, nonrenewable energy sources.

Despite its importance, monitoring the solar energy resource has rarely been a part of traditional weather observations. Accurate solar radiation measurement required moderately expensive equipment, routine instrument inspection, careful operation and regular calibration. Within the past decade, consistent solar energy measurements have been made in selected locations across the U.S. Two sites in Colorado were included as part of a national network: Boulder and Grand Junction. In addition, solar data have been collected in Fort Collins in support of research at Colorado State University related to agriculture, atmospheric science and solar energy applications. Though solar radiation has been monitored in Fort Collins for approximately 10 years, data have often been incomplete and not available for public use for months or years after being collected. Additionally, these monitoring programs rely on year to year funding with no guarantee that they will continue in the future.

The data reported here were collected in the first year of a solar radiation monitoring program undertaken by the City of Fort Collins Light and Power Utility and the Colorado Climate Center at CSU. A unique cooperative agreement was signed in November 1984, in which the Utility agreed to purchase the instrumentation necessary to measure incoming solar radiation on a horizontal surface. The instrumentation is located at the CSU main campus weather station, at which many elements of the Fort Collins climate have been continuously monitored since 1887. The Colorado Climate Center is responsible for the routine maintenance and operation of the equipment, and archival and dissemination of the data. These activities were added to existing data collection procedures at the weather station. Solar data collection began during May 1985 and is planned to continue indefinitely.

This cooperative data collection program provides several advantages. Solar data are now publicly available on a nearly real time basis. The continuous presence of weather station personnel results in high quality data with very few interruptions. The ready availability of the data encourages more use of the data and motivates research ideas from both the renewable energy and the atmospheric science perspective. The program is a logical complement to Utility programs which promote the use of solar energy, and the Utility also hopes to use the information to help to forecast system electrical loads.

2. DATA COLLECTION

The instrumentation used in this program includes:

- a Kipp and Zonen Model CM11 thermopile pyranometer,
- a Li-Cor Model 1776 single channel datalogger (with Model 1776-01 Millivolt Input Module),
- a Radio Shack Model 100 portable computer.

Specifications for the response characteristics of this type of pyranometer appear in Figure 1. A field calibration check showed excellent agreement with the conversion constant supplied by the manufacturer.

The equipment is installed at the CSU campus weather station (just NW of the Lory Student Center). The sensor is mounted approximately 2 meters off the ground with no obstructions within its field of view. The datalogger and computer are located inside the conditioned weather observation office, approximately 20 meters from the sensor.

Instantaneous radiation measurements (total hemispheric) are integrated by the datalogger over an hour long period which ends at the top of each hour. The computer interrogates the datalogger hourly, recovers the most recent hourly value, converts units, stores the data, and updates the daily total. Up to one month of hourly solar data can be stored in the computer, and the datalogger holds the 128 most recent readings in memory as backup protection.

Experience has shown that without regular manual attention, automated data collection systems often fail. Therefore, special effort is made to assure frequent manual evaluation of the system. Every two hours, at times corresponding to the bihourly scheduled weather

KIPP & ZONEN

CALIBRATION CERTIFICATE

PYRANOMETER: KIPP & ZONEN "SOLARIMETER"
 TYPE: CM 10 No. 840535
SENSITIVITY AT 20°: 4.52×10^{-6} V per W/m² (with no load).
 RADIOMETRIC REFERENCE: World Radiometric Reference (WRR).
 CALIBRATION PROCEDURE: Source: 1000 W tungsten-halogen lamp.
 Colour temperature: 3300° K.
 Angle of incidence: normal incidence.
 Standard pyranometer: CM 10 800074
 Orientation of the pyranometers: horizontal.
 Irradiance: 450 - 550 W/m²
 IMPEDANCE: 1411 Ohms at approx 20° C.
 COSINE RESPONSE:
 at zenith angle: 40° -0.3 %
 60° -0.8 %
 70° -1.1 %
 80° 1 %

(expressed as percentage deviation from the ideal proportionality to the cosine) for a radiometrically levelled instrument irradiated by a parallel beam of light (full collimation angle 0.5°)

N.B.

This calibration is referred to WRR.

The WRR is brought into effect from January 1st, 1981.

To express radiation measurements in the old IPS 1956 scale,
WRR irradiances have to be decreased by 2.2 %.

To express sensitivity in mV per cal/cm² min multiply by 0.5978×10^6 .

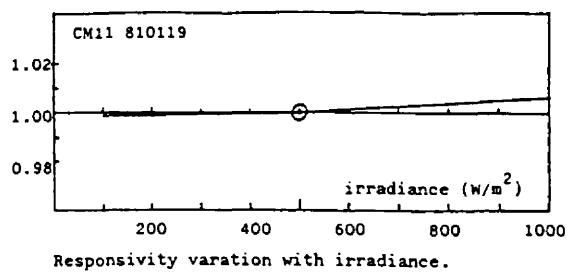

To express sensitivity in mV per W/cm² multiply by 10^7 .

CALIBRATION DATE: September 1984.

KIPP & ZONEN

DELFT/HOLLAND.

TILT EFFECT

Not any tilt effect is observed at irradiance levels up to 1000 W/m^2 .

Relative transmission vs. wavelength of Solarimeter domes for 2 x 2 mm material thickness - 4 surface reflections included (normal incidence) - taking into account the index change with wavelength - calculated from Schott data sheet K5 - 522595.

Figure 1 continued. Response characteristics of Kipp and Zonen Model CM11 thermopile pyranometer.

observations (24 hours a day, 7 days a week), a trained weather observer reads the hourly solar data file on the portable computer and manually records the most recent hourly values on an observation form. Remarks are recorded and the station director contacted if any problem with the data collection system is noted. Each two hours the two most recent hourly solar values are also manually entered into a public access data file on the CSU computer system. In addition, the observer cleans the dome of the pyranometer each morning at sunrise. If precipitation is falling during the day, the observer also wipes the dome clean every two hours throughout the day. This is especially important during periods of snow accumulation.

The weather station director weekly verifies each hourly solar reading for that week and flags problems. Data obviously in error are carefully checked. If cloud cover appeared to be relatively stable through the period in question, values may be estimated. When no estimates are possible, values are eventually replaced by hourly readings from the pyranometer operated by the Atmospheric Science Department at the CSU foothills campus. If no data are available to produce an estimate, a zero value is entered along with an appropriate flag for missing data. Data in question for other reasons are marked as "suspect."

This verified data set is uploaded from the weather station portable computer to a public access file on the CSU Cyber mainframe computer system. The final archive file is maintained under Colorado Climate Center control on a VAX computer system in the Department of Atmospheric Science and is updated monthly. Summary tables are printed each month giving hourly and daily totals and hourly averages. These

tables, in a format similar to the data tables in this report, are available from the Center a few days after the end of each calendar month.

Hourly and daily global solar radiation data from this cooperative program are disseminated to users in a variety of ways. Data from recent months can be obtained in hard copy form from the Colorado Climate Center, or accessed on either the CSU GREEN computer system or the Atmospheric Science Department's VAX system (in both cases, prior arrangements must be made with the Center to insure user access). For more recent data and for near real-time access, there are also several options. Small amounts of data may be obtained via a phone request to the weather station, the Colorado Climate Center or the Utility. Access to the appropriate data file on the CSU GREEN system can also be granted on request. For broader dissemination, daily solar radiation values are published each month as part of the "Sunshine and Solar Radiation" section of Colorado Climate, a monthly statewide climate information publication of the Colorado Climate Center.

3. OPERATIONS SUMMARY

The Fort Collins cooperative solar data collection program has been in operation for more than one year. There have been several minor problems during this first year, but they have had little impact on the overall data quality and most have been solved.

The majority of the suspect values and some of the estimated values are due to moisture in the pyranometer electrical connector. Following periods of rain, nighttime values significantly above zero were

sometimes recorded. The nighttime effect is obvious, but it is impossible to accurately estimate the error in the daytime measurements. Any hourly value which may have been affected by this problem has been labelled "suspect" even though the effect may have been very small.

The automated data transfer from datalogger to computer occasionally failed for unknown reasons. In most of these cases missing data could be manually recovered from the datalogger's internal memory. In a few isolated instances, the datalogger skipped an integration period or produced spurious hourly values. No pattern to this behavior has been discernible.

A final problem, due to an interaction between the datalogger and portable computer, was a timing error which accumulated at a few seconds per day. When first recognized, the integration period had been shifted forward by approximately 15 minutes and was resetting at 15 minutes after the hour rather than at the top of each hour. Hourly total values, therefore, do not correspond exactly with the time period listed, but this caused no error in the daily totals. After September 1985 time errors were held to five minutes or less by making small modifications in the operating procedures and by manually resetting the clock twice a month. In early 1986 the problem was solved. Time errors were logged by weather observers so that corrections to hourly values can be made if necessary.

Despite these problems, overall data quality is excellent. During the period 1 June 1985 through 31 May 1986 there were 4870 hours with potential sunlight. Only 61 hourly values (1.3%) were missing or in error, and for all of these, estimates were possible using procedures outlined above. Additionally, 134 hourly values (2.8%) were flagged as

"suspect." For these, although individual hours may have large relative errors (i.e. twilight hours at dawn and dusk), impacts of these suspect readings on daily totals is believed to be very small (on the order of 1 to 5%). The remaining hourly values all appear to be correct within the accuracy of the instrumentation. The first year data recovery rate is, therefore, 96% or better. This data quality and recovery rate is much higher than reported by either the National Solar Radiation Network or previous CSU data collection programs. Much of this success is due to the routine manual intervention which is part of the weather station standard operating procedure.

4. DATA SUMMARY

The graphs and tables which follow depict the solar energy climate of Fort Collins, Colorado, during the 1 June 1985 through 31 May 1986 period. All hourly values and daily totals are presented in Table 1-12. Figures 2-13 plot the daily radiation totals and, for comparison, the extraterrestrial radiation (the amount of energy received on a horizontal surface in the absence of the atmosphere). Days including one or more estimated or suspect hourly values are flagged accordingly. Figure 14 presents the distribution of daily total solar radiation for the entire year. Hourly solar values for select clear days in December and June (near the winter and summer solstices, respectively) are displayed on Figure 15. A comparison shows almost exactly three times more solar radiation falling on a horizontal surface for a clear day in June than December. Finally, monthly values of average daily solar radiation are compared to the Fort Collins averages for the 1975-1985

period developed from the data collected at the CSU Atmospheric Science Department on the foothills campus (Table 13 and Figure 16). Monthly values for 1985-1986 are higher than average for five months and lower than average for seven months. For the year as a whole, total solar energy received on a horizontal surface nearly equalled the 1975-1985 average.

Conversion factors are given in Table 14 to convert the units used in this report (Megajoules per square meter) to other commonly used solar energy units.

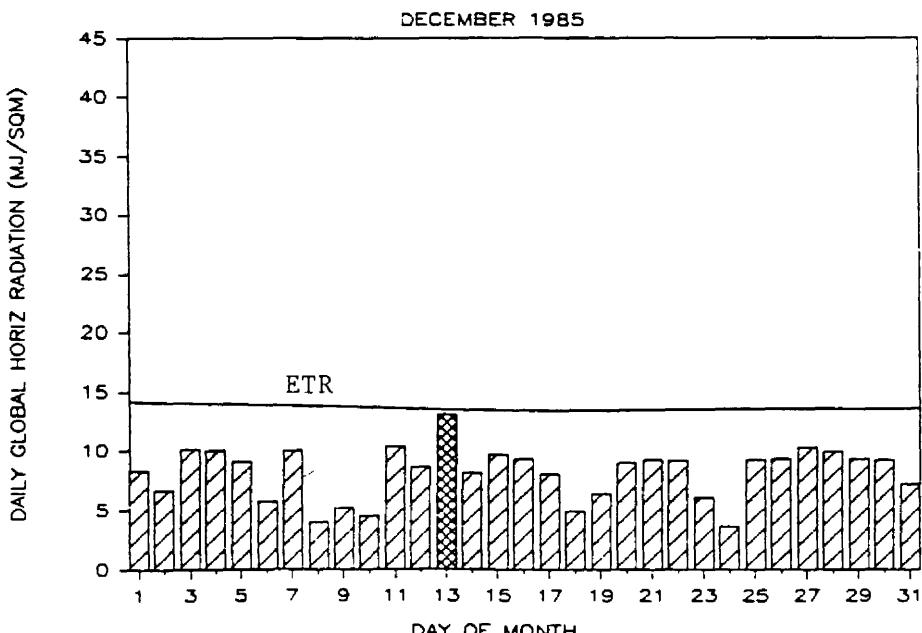

Figure 8. Daily global radiation on a horizontal surface (MJ/m^2) on the campus of Colorado State University for December 1985.

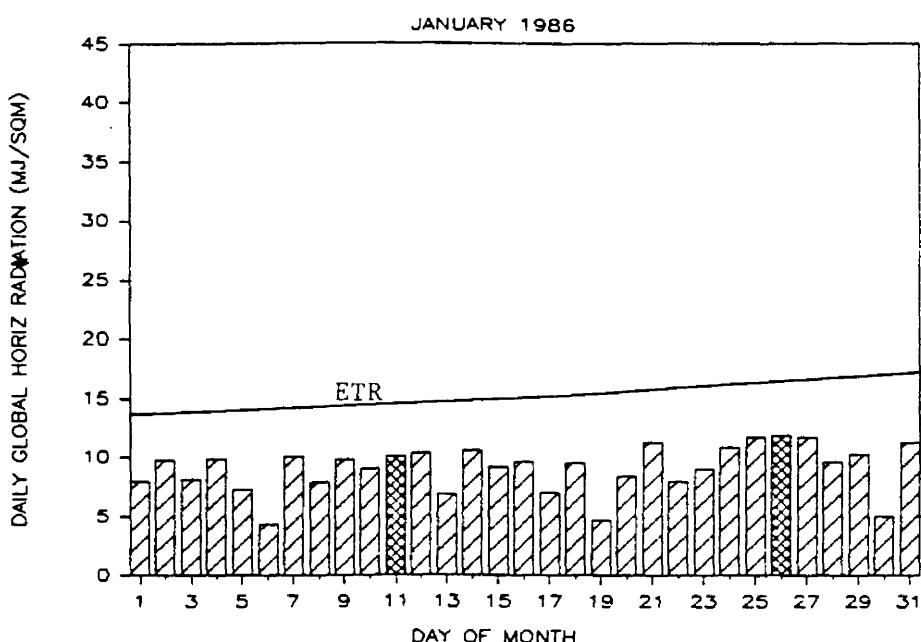

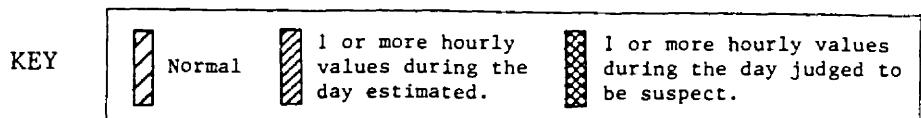

Figure 9. Daily global radiation on a horizontal surface on the campus of Colorado State University for January 1986.

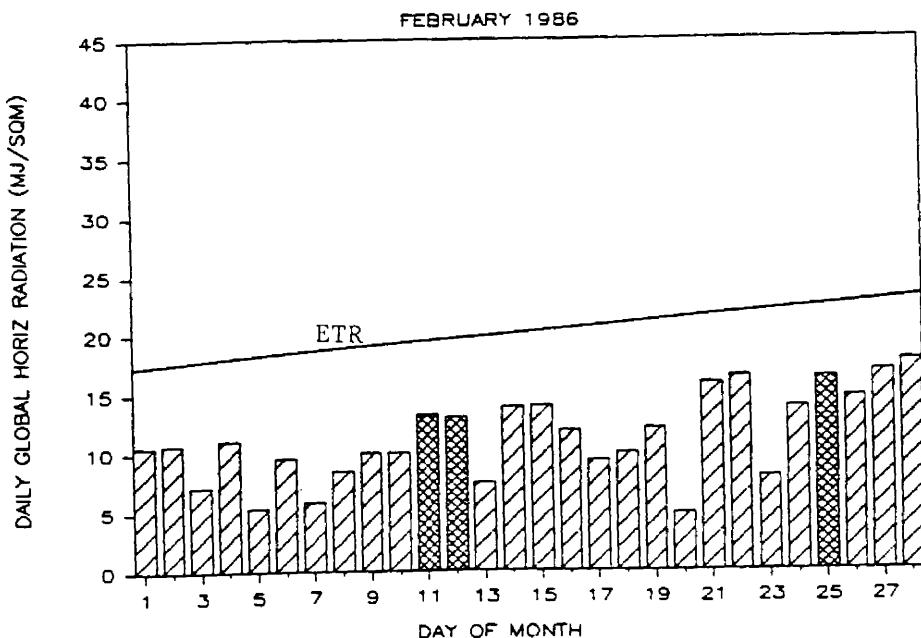

Figure 10. Daily global radiation on a horizontal surface (MJ/m^2) on the campus of Colorado State University for February 1986.

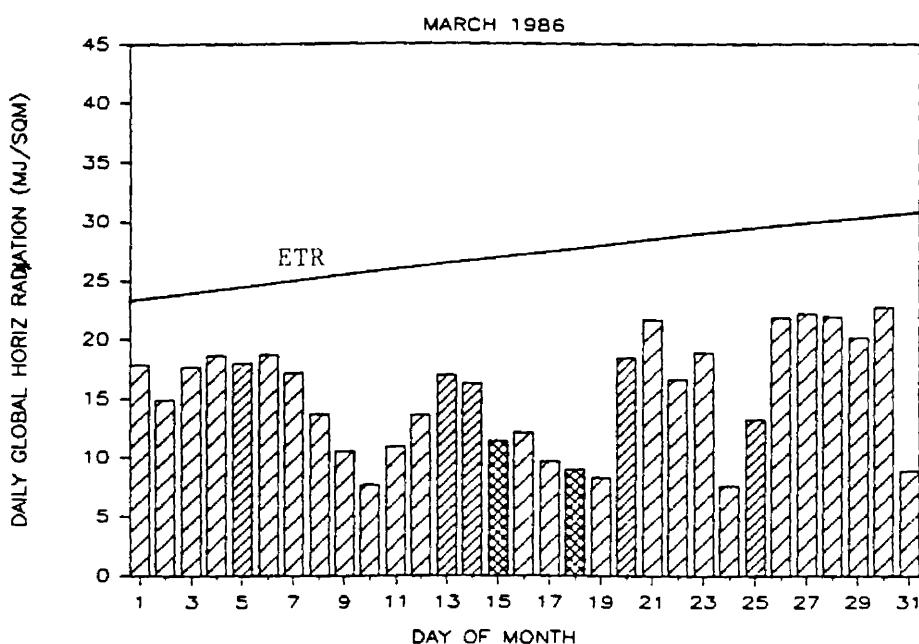

Figure 11. Daily global radiation on a horizontal surface on the campus of Colorado State University for March 1986.

KEY

	Normal		1 or more hourly values during the day estimated.		1 or more hourly values during the day judged to be suspect.
--	--------	--	---	--	--

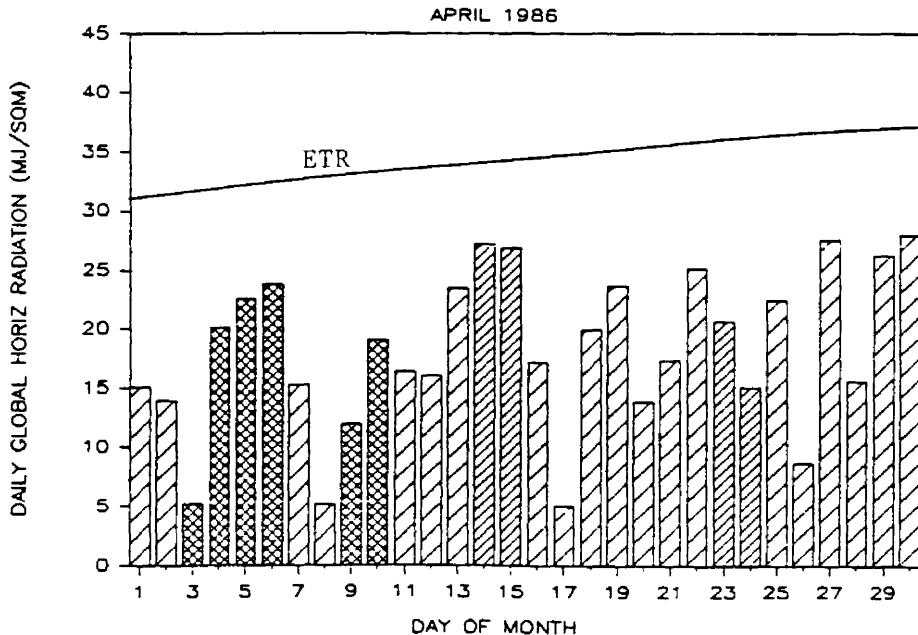

Figure 12. Daily global radiation on a horizontal surface (MJ/m^2) on the campus of Colorado State University for April 1986.

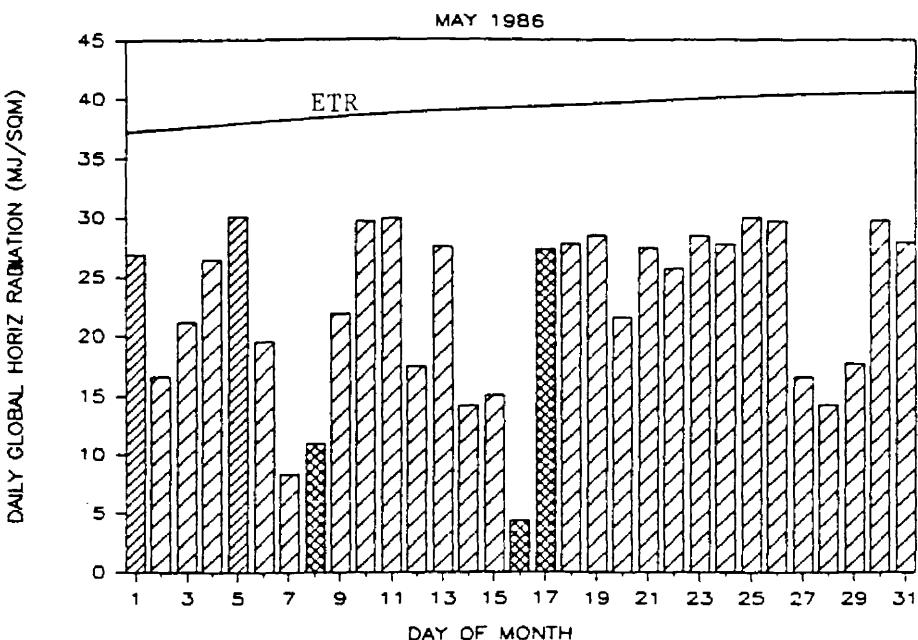

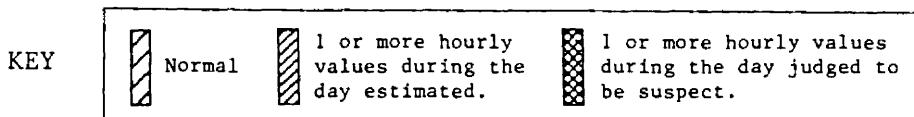

Figure 13. Daily global radiation on a horizontal surface on the campus of Colorado State University for May 1986.

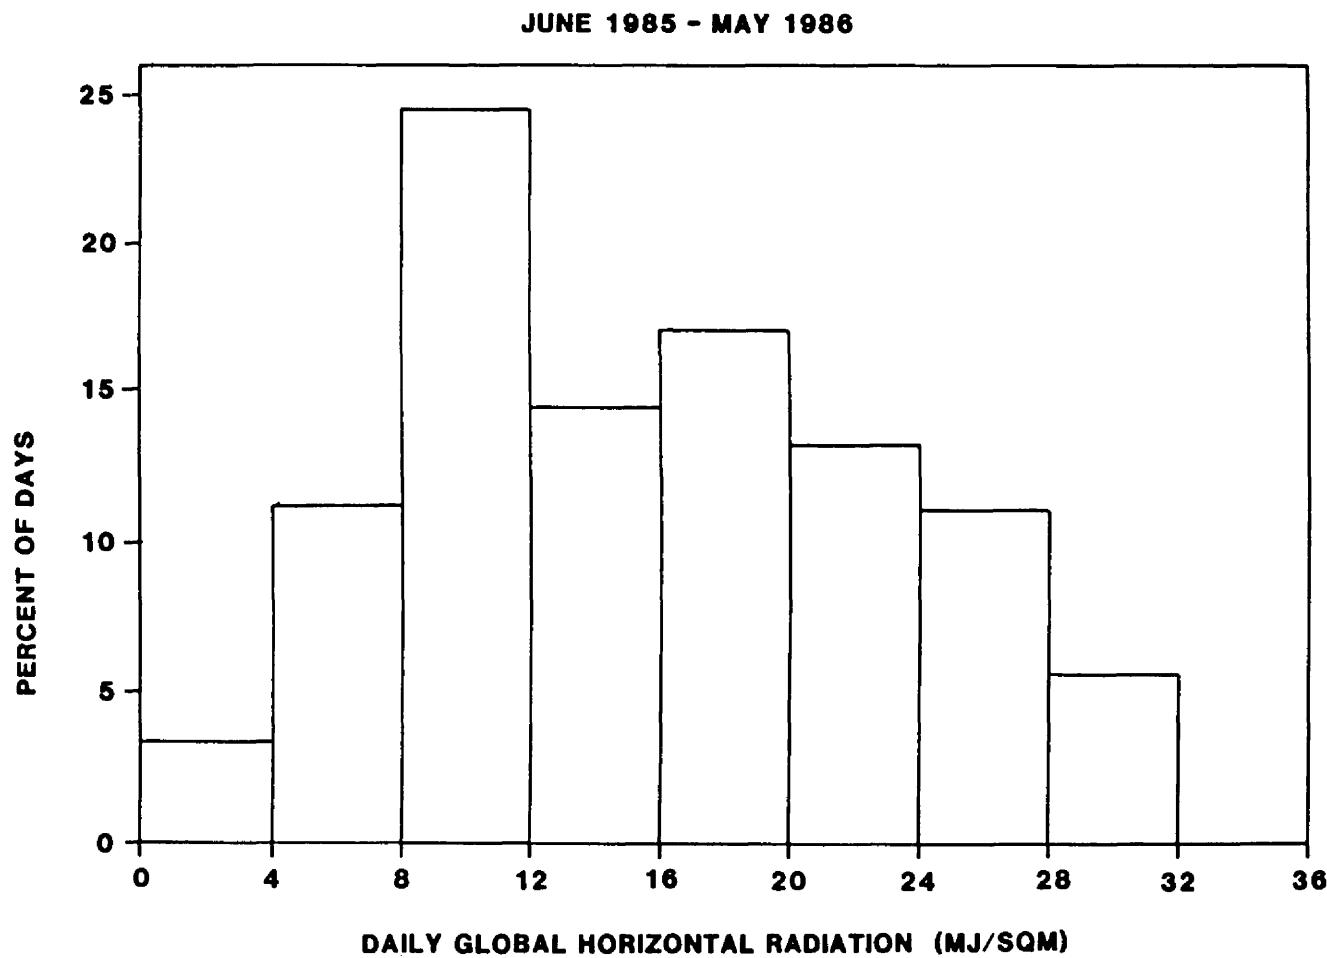

Figure 14. Annual frequency distribution of daily global horizontal (hemispheric) radiation for the 12-month period June 1985-May 1986 at Fort Collins, Colorado.

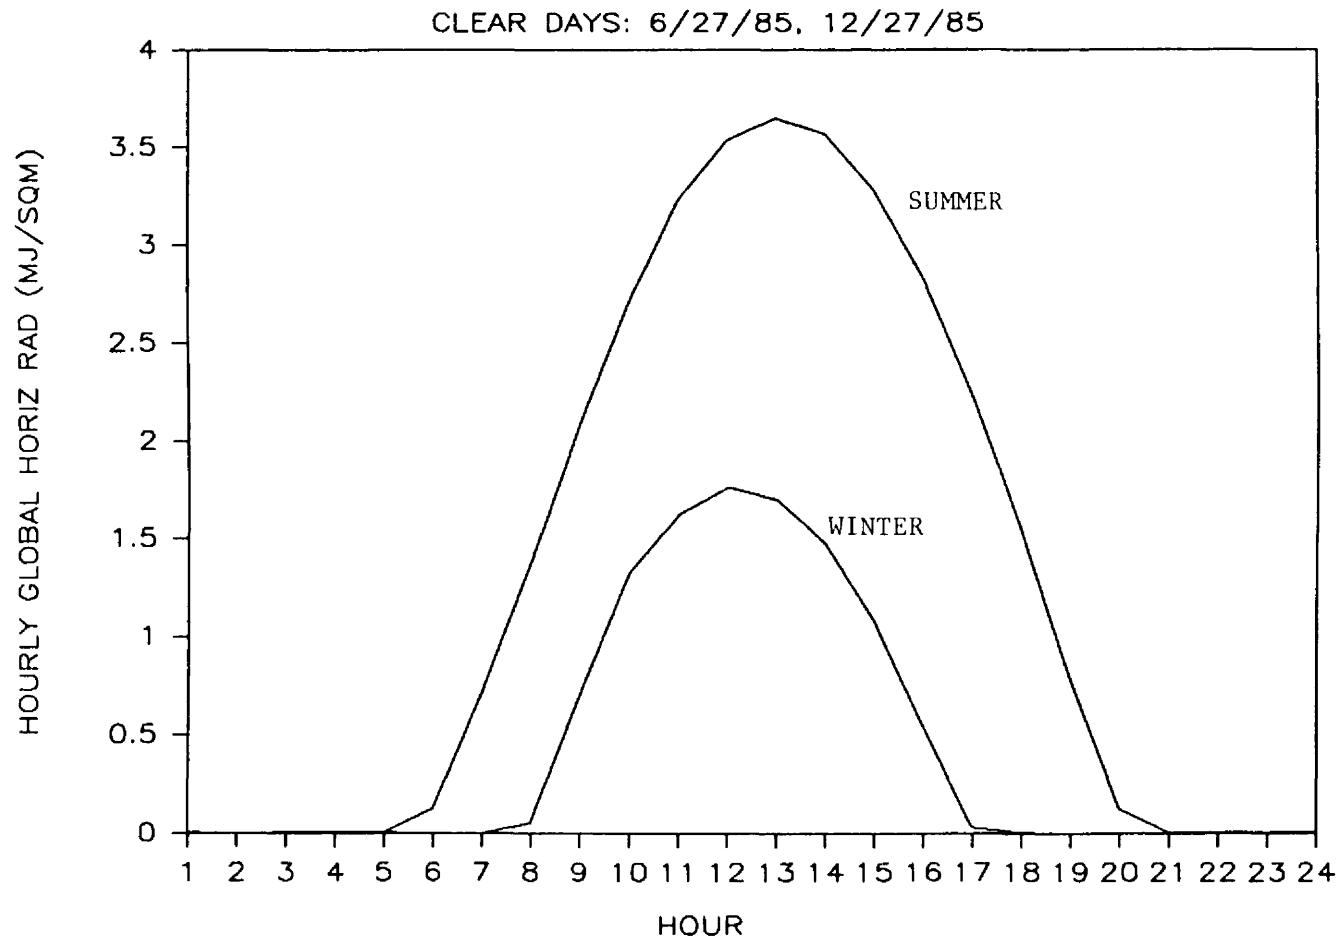

Figure 15. Comparison of hourly distribution of solar energy on a clear day in winter and summer.

Table 13.

**Fort Collins, Colorado, Solar Radiation Summary,
June 1985-May 1986.**

Month	Total Hemispheric Mean Daily Solar Radiation	Average*	Percent Departure
	(MJ/M ²)		
June 1985	23.81	23.76	+0.2%
July	20.71	22.67	-8.6%
August	20.96	20.01	+4.7%
September	15.70	16.75	-6.3%
October	13.24	13.74	-3.9%
November	8.64	8.92	-3.1%
December	8.22	7.26	+13.2%
January 1986	9.08	8.58	+5.8%
February	11.39	11.93	-4.5%
March	15.42	16.18	-4.7%
April	18.30	19.09	-4.1%
May	22.57	21.20	+6.5%
Annual	15.67	15.76	-0.6%

*Average based on 1975-1985 data collected at Colorado State University foothills campus, Department of Atmospheric Science.

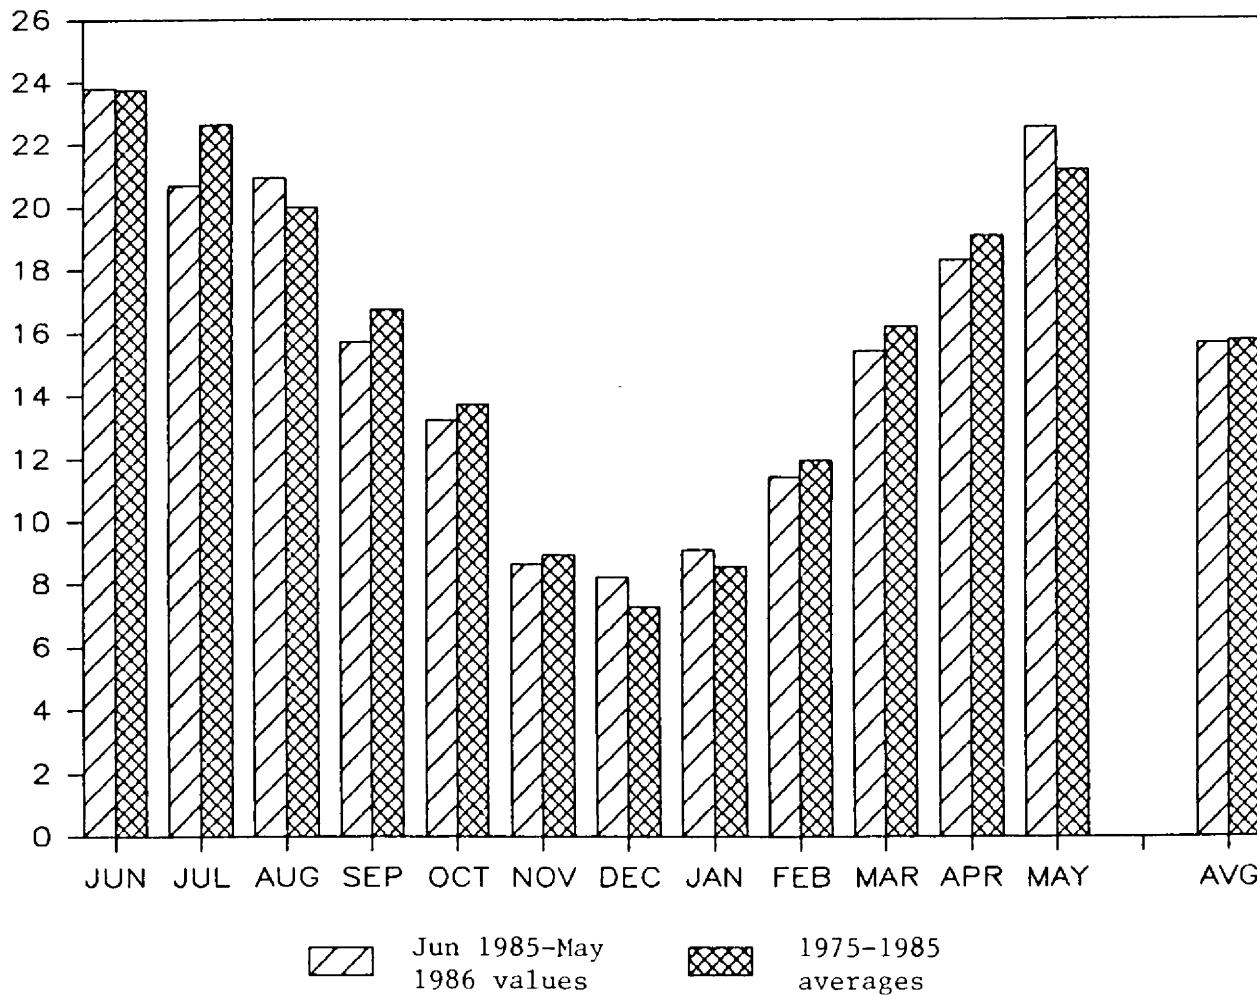

Figure 16. Comparison of Fort Collins monthly averaged daily solar radiation (MJ/m^2) for June 1985 through May 1986 with 1975-1985 monthly averages (from Table 13). The 11-year average is based on data collected by the Colorado State University Department of Atmospheric Science on the Foothills Campus.

Table 14.
Solar Radiation Conversion Factors.

To Convert from	To	Multiply by
1 MJ/m^2	J/m^2	10^6
	KJ/m^2	10^3
	W-hr/m^2	277.78
	Langleys	23.9
	Btu/ft^2	88.11
