A Snapshot of Colorado's Climate

During the 20th Century

For the past century, cooperative weather observers have been diligently recording temperature and precipitation each and every day from farms, ranches, towns and cities throughout Colorado and across the United States. The true value of this effort is only realized when those many daily observations are assembled, analyzed and utilized.

This report is a summary description of Colorado climate derived from a small set of Colorado's long-term weather stations. Special graphical displays have been developed to depict the interesting aspects of daily averages, variations and extremes for both temperature and precipitation. Standard tables of temperature, precipitation, heating and cooling degree days, growing season statistics and snowfall are also included. The seven locations analyzed in this report are identified in Table 1 and shown on the map in Figure 1. Stations from all parts of Colorado are included in an attempt to represent the climate near the mountains, on the Western Slope of Colorado, along the Front Range just east of the mountains and also across the Eastern Plains. There are areas in the State that are both wetter and drier, hotter and colder than the sites shown here. However, these seven sites capture many of the significant features of Colorado climate.

Table 1. Selected Long-term Colorado Weather Stations

Station Name	Latitude		Longitude		Elevation	Years of Data Used	
	deg	min	deg	min	feet	Daily	Monthly
Akron Airport	40	10	103	13	4660	53	53
Cheyenne Wells	38	49	102	21	4250	72	59
Durango	37	17	107	53	6600	90	96
Fort Collins	40	35	105	05	5000	90	59
Gunnison	38	32	106	56	7660	89	91
Rocky Ford 2ESE	38	02	103	42	4170	72	59
Steamboat Springs	40	29	106	50	6760	81	59

There are five pages of information for each station. The first page is a graph that shows daily averages, extremes and typical ranges of variation for both daily maximum and minimum temperatures. The second page contains a set of three graphs depicting different characteristics of precipitation. The top graph shows daily probabilities for receiving at least 0.01, 0.05, 0.10, 0.20, and 0.50 inches in 24 hours. The middle graph shows both the average daily precipitation (expanded scale) and the maximum precipitation that has been observed on each day. The bottom graph shows how precipitation has varied from year to year over the past decades. The graph also shows how much each season contributed to precipitation each year. If any monthly data were missing in a given year, no annual value was plotted.

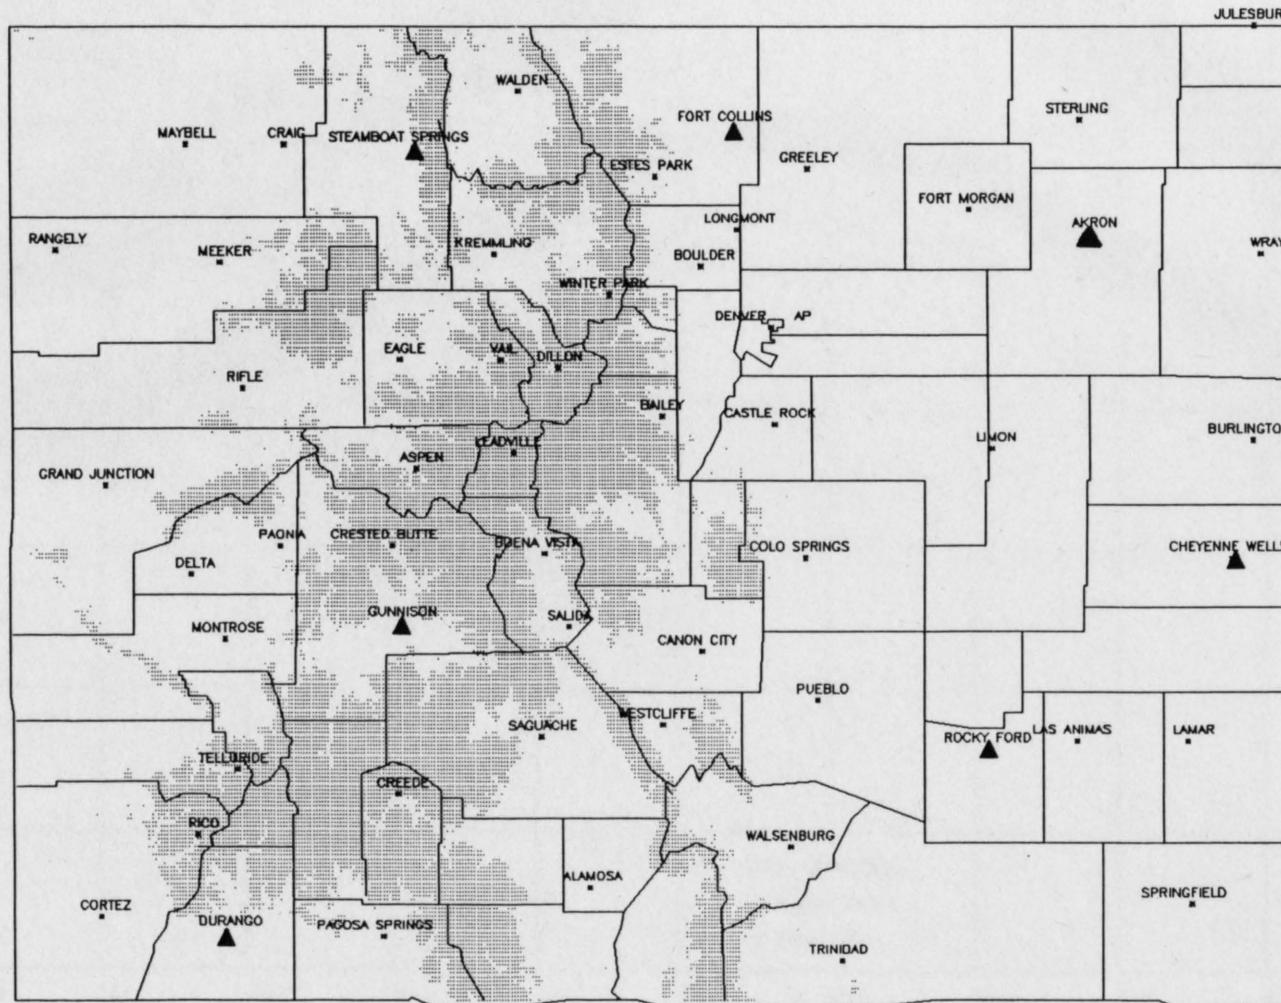

Tabular data then follow. The third page contains great detail on heating degree days, cooling degree days, growing degree days and growing season lengths. Page 4

shows summarized monthly temperature information. Finally, the 5th page in each set summarizes monthly precipitation and snowfall.

Following the sets of graphs and tables for these 7 long-term Colorado weather stations, a complete list of current official weather stations is listed. Similar graphs and tables can be generated for most of the stations on this list. Many of those stations, however, have much shorter data records.

Figure 1. Locations of weather stations summaries in this report (identified with triangles).
